## PainChek® helping the vulnerable in aged care by safely assessing pain during the COVID-19 pandemic.

Regular pain assessments are of even greater importance for the vulnerable during the COVID-19 pandemic as chronic pain may be associated with an impaired immune system<sup>1</sup>

In the community, more than 50% of those living with dementia experience pain daily. In aged care homes around 60-80% of people living with dementia regularly experience pain. In total, across Australia, this impacts more than 400,000 people<sup>2</sup>

PainChek accurately assesses pain for these vulnerable people living with dementia and cognitive impairment and who cannot verbalise or self-report pain reliably.

PainChek also allows carers to safely and rapidly conduct a pain assessment that complies with the government's social distancing requirements, minimising risks for both carers and residents.

The App is downloaded through standard smart devices. Assessments may be conducted from up

to 3 metre distance and takes no more than 3 minutes to complete.

The full pain assessment can be completed without physical contact between carers and residents supporting infection control procedures.

On-line training for carers is available through our e-learning platform, whilst administration and storage of pain scores is automatic, eliminating paper handling.

All resident and assessment data is automatically loaded and saved in Platinum 5. This eliminates double handling of data and any need to leave the floor to complete assessment documentation.

PainChek is now available free-of-charge for a 12-month period for all Australian Residential Aged Care facilities through a Federal Government funded initiative. This is for a limited time period.
